# A New Era in Manifolds FM-SOLID MANIFOLD X88M series

# Koganei proposes a new solution for pneumatic control systems.

Today's production lines are experiencing rapid evolution toward more systematic and automated line configurations.

In response to this situation, Koganei offers "an integrated pneumatic world" of components.

One example is the FM-SOLID MANIFOLD, which "modularizes" the functions of the valves, wiring, piping, air preparation, vacuum, serial transmission and so on. You can build a system to meet your production line requirements by selecting and combining the most suitable modules. This enables a substantial reduction in design work and cost due to the high integration of the modules and space saving installation.

Koganei's new solution for pneumatic control systems is compatible with every requirement on the production site.

What is the integrated pneumatic world?

## **INTEGRATION**

You can construct pneumatic systems without paying extra attention to the connections between various pneumatic components.

# INTELLIGENCE

Due to the improved functions of each component, you can decentralize controlling units.

# INTERFACE

You can easily connect various control equipment and peripheral devices.

#### **Module Configuration Outline**

## FM-SOLID MANIFOLD X88M series Module Configuration

p.433

a biocks, p.483

# **Examples of FM-SOLID MANIFOLD X88M Configuration**

#### (Configuration Example 1) Simple, Wire-Saving Type

#### Features

- •Using end block piping achieves space efficiencies.
- •Uses a terminal block type wiring module capable of responding to manifolds with up to 8 solenoids.

der code: X88M-ED No.1-FMC-T100 No.2~5-FMX110-4E1 No.6-FMX110-4KE2 No.7-FMX113-4KE2

427

#### (Configuration Example 2) 110, 180 and Ejector Combination Mounting Type

#### Features

- •Collective wiring for operation signals of valves (110 and 180) and ejectors.
- Output isolators for the air supply/ exhaust between the valves and ejectors, makes individual air supply/exhaust possible, and ensures steady operations of the ejector.
- The vacuum switch sensor signal can be extracted individually.

No.12-FMP-FJ10L No.13-FMB-A (port isolator) No.14-FMJ05E2-J4S-E No.15-FMJ07E1-J6S-E No.16-FMP-FJ10L

#### (Configuration Example 3) Pressure Monitoring Type with Mounting Regulator

#### Features

- Mounting a regulator adjusts compressed air to the optimum pressurized air.
- •A sensor with digital pressure gauge monitors the air pressure.

Order code: X88M No.1-FMC-T100 No.2-FMP-FJ10L No.3-FMR200-GA20 No.4-FMS220-PL No.5~9-FMX180-4E1

#### (Configuration Example 4) Wiring-Saving Type with Serial Transmission

#### Features

- Mounts a serial transmission module, to greatly reduce wiring man-hours and to offer easy maintenance.
- Multiple installation of piping modules serves to prevent pressure drops due to simultaneous operation of valves.

de: X88M No.1-FMT-OR No.2~9-FMW180-4E1-J6S No.10-FMP-FJ10L No.11,12-FMW180-4KE2-J6S No.13,14-FMW183-4KE2-J6S No.15-FMP-FJ10L

#### (Configuration Example 5) Dual-use Type for Parallel and Serial Transmission

#### Features

- •Uses the same manifold to conform to either parallel transmission or serial transmission.
- Installs 0.7W specification valves (as a special order).
- Mounting onto a DIN rail simplifies mounting of remote I/O stations and other equipment.

#### Precautions for making order

- •For the wiring module, select FMC-F201.
- ●The solenoid valve for the manifold should be a low current specification of DC24V (0.7W with LED). Specify the valve module type by adding "-001W." However, "-001W" is not required for the tandem solenoid valve (FMY□).
- Purchase both the cable type G79- and transmission terminal type G-71-OD16 (DC24V) from OMRON separately.

Order code: X88M-DN No.1-FMC-F201 No.2~17-FMW110-4E1-J4S-001W No.18-FMP-FR02

#### (Configuration Example 6) Wiring Branch Type for Operating Other Valves, Relays, etc.

#### Features

- Branching the serial transmission module's 16 operating signals to the outside of the manifold enables the operations of other devices to achieve the effective use of contact points.
- •Can also operate devices by using the parallel transmission module.
- Wiring modules on the branch side can also be selected.

#### Precautions for making order

- A wiring branch manifold requires a special order. Consult us.
- ●For external devices, purchase Matsushita Electric Works' relay (PC relay terminal AY112402, etc.), or OMRON's relay terminal (I/O relay terminal G7TC-OC08, etc.).

Order code: X88M-DN No.1-FMT-No.2-FMC-FJ10L No.3 ~ 11-FMW180-4E1-J6S No.12-FMC-F201-13W

## **Module Mass and Dimensions**

# **Manifold Order Codes**

#### **Order Codes**

other. In addition, if the total number using I/O requires 9 to 16 terminals, we recommend using the wiring module type with wiring bushing connection specifications (FMC-T180).

#### FM-SOLID MANIFOLD X88M Series Basic Specifications

Item	Manifold basic model	X88M
Media		Air
Operating pressure range	MPa {kgf/cm <sup>2</sup> } [psi.]	0.15~0.7 {1.5~7.1} [22~102]
Proof pressure	MPa {kgf/cm <sup>2</sup> } [psi.]	1.05 {10.7} [152]
Operating temperature ran	ige °C [°E]	5~50 [/1~122]
(atmosphere and media)	0[1]	
Wington		Collective wiring type with wiring module
wining type		(Flat cable connector type, D-sub connector type, Terminal block type)
End block		End block module type/End block piping type
Manifold mounting type		Direct mounting type/DIN rail mounting type
Common terminal wiring		Positive common/Negative common

#### Order codes for additional parts (To be ordered separately)

DIN rail mounting bracket (1 set)

Sticker for solenoid top surface (1 set of 5 sheets) OSticker for valve top surface

#### About a port isolator

Use of a port isolator at an intermediate position on the manifold and installing a piping module to an individual group makes the use of 2 or 3 different pressures possible, and prevents exhaust interference from the main exhaust. When ordering, enter a port isolator as 1 module.

#### Port isolator type

Туре	Function
FMB-A	1(P), 3, 5(R) port all port block
FMB-P	1(P) port block
FMB-R	3, 5(R) port block

%Although port isolators can be installed into modules at any location, they cannot be disassembled to change the position after shipping.

## **Manifold Order Codes (With Compact Serial Transmission Block)**

**Order Codes** 

<sup>\*</sup>Order them for maintenance use only.

Internal wiring and mounting screws, etc. are not included.

## Manifold Order Codes (With Serial Transmission Block)

#### Order Codes for Serial Transmission System for OMRON CompoBus/D

- Notes: 1. Since the shape and wiring configuration for OMRON CompoBus/D differ from those of other serial transmission types, a wiring module is required as module No.1. For module No.1, always enter the wiring module FMC-F201 DC24V.
  - 2. The end block is an end block module type only, and no end block piping type is available. Therefore, always select the piping module in the case.

#### Order code for serial transmission block only

%Order it for maintenance use only. Mounting screws, etc. are not included.

#### Manifold configuration

1. The number of the modules should be a total of 20 or less.

- 2. When a voltage drop is considered to be possible, such as when a multiple number of valves are operated simultaneously on a multiunit manifold (11 or more on the 110 series, and 5 or more on the 180 series), or for high cycle applications, install a piping module at an intermediate position of the manifold. For details, see the piping module precautions on p.494.
- 3. Combination mounting of the 110 and 180 series is acceptable.

#### Piping

When not designating an end block piping type (-ED), select a piping module.

#### Common wiring

When the PC side is positive common, select -CM (negative common) for the manifold's common terminal wiring.

#### Voltage

Some voltages may not be applicable, depending on the module.

Table of corresponding voltages

Voltage, numbers Module			DC12V	DC24V	AC100V	AC200V	No. of compatible solenoid <sup>Note</sup>	
		FMC-F20	0	0	×	×		
Wiring	Parallel wiring	FMC-D250 FMC-E250	0	0	0	×	16	
, while g		FMC-T100	0	0	0	0	8	
		FMC-T180	0	0	0	0	16	
Serial transmission	Serial transmission	FMT-	×	0	×	×	16	
Air	Pressure switch	FMS11	0	0	×	×		
preparation mo	module	FMS220	0	0	×	×		
Ejector		FMJ	0	0	0	0	—	

Note: If this exceeds 16 solenoids, consult us.

#### Arrangement

Depending on the module, mounting of it is not possible at some locations.

Module		Wiring						Air		
Installed		FMC				trans-	Piping	prepara-	Valve	Ejector
location	-F20 🗌	-D250	-E250	-T100	-T180	mission		tion <sup>wole 2</sup>		
Left side	0	0	0	0	0	0	0		0	0
Middle	0	0	×	0	×	×	O <sup>Note 1</sup>		0	0
Right side	0	0	0	0	0	0	0	×	0	0

Notes: 1. Intermediate positioning is O…Can be mounted anywhere not allowed for FMP-PR02L.

2. For details, see the following precautions on air preparation.

- △…Depends on the mounting sequence
- X····Mounting not allowed

#### Air preparation

Because the filter and regulator have installing directions, always order in the sequence shown in diagrams 1 and 2 below. The module installing sequence is unchanged even if 1 pc. of the filter module, regulator module, or pressure switch module is mounted, or if 2 pcs. of them are mounted. When mounting the collective wiring type pressure switch module, however, install a terminal block module and block-off plate module after the wiring module as attachments for the pressure switch module, as shown in diagram 2 below.

1 When mounting the filter module, regulator module, and pressure switch module (individual wiring type)

2 When mounting the filter module, regulator module, and pressure switch module (collective wiring type)

Note: When using a module with collective wiring type (plug-in) pressure switches, a terminal block module for pressure switches is also required. In this case, a module with a block-off plate is mounted as an attachment to the space between the wiring module for the solenoid valves and the terminal block module for the pressure switch. Since these 2 attachment modules are accessory items, there is no need to enter the module number when placing orders.

#### Exhaust interference

There is a rare possibility of exhaust interference occurring when a multiple number of valves are operating simultaneously, or a 3-port valve has been mounted in combination, or when all port female thread-type piping is used and the exhaust port is connected to the outside. In that case, see the piping module precautions on p.494.

# **Module Order Codes**

#### Wiring Module Order Codes

			•	Mounting th D-sub conne M2.6 thread M3 thread #4-40-UNC thr	reads for ector : -M2.6 : -M3 ead : -UNC	Wiring outle Left side ty Right side Lower left s Lower right	et direction pe : -L type : -R side type : -LS side type : -RS

F1W110-BP (for FMW, FMY)	F1W180-BP (for FMW, FMY)

# FM-SOLID MANIFOLD X88M series

## **Wiring Modules**

#### Features

Achieves space savings and enables lower costs by reducing wiring man-hours.

#### Flat cable connector

A 20-pin flat cable connector can accommodate up to 16 solenoids.

Two types of pin locations are available for the wiring.

Various kinds of cables and connectors are also provided to simplify wiring connections.

#### D-sub connector type

A 25-pin D-sub connector can accommodate up to 16 solenoids.

Various kinds of cables and connectors are also provided to simplify wiring connections.

## D-sub connector, side connection specification

Can be connected on either the right or left side, to save on height in the connector portion and improve space efficiency. A 25-pin D-sub connector can accommodate up to 16 solenoids.

#### **Terminal block type**

A terminal block with 10 terminals can accommodate up to 8 solenoids.

#### Wiring bushing connection type

Wiring outlets can be selected in any of 4 directions, for increased flexibility in wiring work.

An 18-terminal terminal block can accommodate up to 16 solenoids.

Model	Wiring connection specification	Remarks
FMC-F200 FMC-F201	Flat cable connector type	Made by Sumitomo 3M Box type with long clip Part number: 3428-5002LCSC
FMC-D250-M2.6 FMC-D250-M3 FMC-D250-UNC	D-sub connector type <sup>Note</sup>	Made by Japan Aviation Electronics Industry Part number: DBU-25P-FO Mounting threads for
FMC-E250-M2.6 FMC-E250-M3 FMC-E250-UNC		D-sub connector -M2.6: M2.6 thread -M3: M3 thread -UNC: #4-40-UNC thread
FMC-T100	Terminal block type	Terminal block thread: M3
FMC-T180-L FMC-T180-R FMC-T180-LR FMC-T180-RS	Wiring bushing type	Terminal block thread: M3

Note: While a shell is not provided on the socket side, it can be used regardless of manufacturer's types, only if the number of pins is 25. Care must be exercised with selection of the shell mounting screws, however.

Application example: For FMC-E250-M2.6, products made by Japan Aviation Electronics Industry Socket model: DB-25S-N Shell model: DB-C2-J9

#### **Module Mass**

	9 [02.]
Model	Mass
FMC-F20	95 [3.35]
FMC-D250-	95 [3.35]
FMC-E250-	210 [7.41]
FMC-T100	100 [3.53]
FMC-T180-	435 [15.34]

a [oz ]

# Number of Solenoids Which Can Be Connected to a Wiring Module (Possible Number of Connections)

(1 solenoid for 4E1 type, and 2 solenoids for 4KE2 type)		
Piping module model	Number of solenoids	Number of pins (terminals)
FMC-F200	16	20 pipe
FMC-F201	10	20 pins
FMC-D250-M2.6		
FMC-D250-M3	16	25 pins

## **Serial Transmission Modules**

#### Features

- One cable directly connects the PC's (Programmable Controller) remote I/O main station and the remote I/O sub-station for the dedicated use of manifold solenoid valves.
- Direct transmission from the PC main station achieves great reductions in wiring man-hours, and fewer breakdown free operation due to the wrong wiring or breakage in the wiring. It also reduces maintenance work, and enables quick response to system changes.
- Decentralized control from the PC is allowed, achieving large wiring savings and reduced costs when long-distance or centralized control is required.
- We assemble and deliver serial transmission blocks and various other modules required for various manufacturers' PCs, according to orders received.

#### Manufacture's name/serial transmission system

#### **General Specifications**

Voltage	DC24V ±10%	
Operating temperature range	5~50°C [41~122°F]	
Vibration resistance	49.0m/s <sup>2</sup> {5.0G} (Conforms to JIS C 0911)	
Shock resistance	98.1m/s <sup>2</sup> {10.0G} (Conforms to JIS C0912)	

For details of specifications, see the user's manuals (see below).

#### Compact Serial Transmission Block, Terminal Block (LED) Names

#### ● For UNI-WIRE<sup>®</sup> System

Transmission block specification: -01 (16 outputs), -02 (8 outputs)

# Address setting swtich

#### LED indicator

Indicator	Description
POWER	<ul> <li>Lights up when power is turned on</li> <li>Flashes during voltage drops or when over current (a short circuit)</li> </ul>
SEND	•Flashes during normal transmission •Lights up or shuts off during faulty transmission

#### Remarks

\* The UNI-WIRE® System is a serial parallel transmission system developed jointly by NKE and KURODA PRECISION INDUSTRIES. For details of the UNI-WIRE System, see the NKE or KURODA PRECISION INDUSTRIES catalog, user's manual, etc.

- Number of outputs per block 16 solenoids (transmission block specification: -01) 8 solenoids (transmission block specification: -02)
- Related materials: User's manual, document No. HV005

#### For OMRON B7A Link Terminal

Transmission block specification: -31 (standard type), -32 (high speed type)

#### LED indicator

Indicator	Description
PWR	<ul> <li>Lights up when power is turned on</li> </ul>
ERR	<ul> <li>Lights up during faulty transmission</li> </ul>

#### Remarks

Connection method: 1 to 1		
(Transmission block spec.) Standard type (-31) High speed type (-32		
Transmission delay time	Max.31ms	Max.5ms
Transmission distance	Max 500m	Max 100m

- \*For details of the B7A Link Terminal, see the OMRON catalog, user's manual, etc.
- Number of outputs per block Maximum of 16 solenoids
- •Error output specifications Output mode: NPN open collector Rated load voltage: DC24V Output current: Sink current MAX. 40mA

#### For Mitsubishi Electric MELSECNET/MINI-S3

Transmission block specification: -11

Rotary switch for station number setting

#### LED indicator

Indicator	Description
PWR	<ul> <li>Lights up when power is turned on</li> </ul>
RUN	·Lights up for normal data communication with master station
SD	<ul> <li>Flashes during sending data</li> </ul>
RD	<ul> <li>Flashes during receiving data</li> </ul>
ERR	•Lights up when data receiving error occurs, shuts off for normal communication

#### Remarks

- Master station: MELSEC-A series AJ71PT32-S3, AJ71T32-S3, A2CCPU/A2CJCPU, A1SJ71PT32-S3, link sub-stations up to a maximum of 64 stations, and link I/O numbers up to a maximum of 512.
- %For details, see the Mitsubishi Electric's sequencer MELSEC-A series catalog, user's manual, etc.
- Number of outputs per block
- Maximum of 16 solenoids \*Since the block is equivalent to 2 stations, if substations are entirely composed of the blocks, the maximum becomes 32 units.
- Related materials: User's manual, document No. HV006

#### For KOYO ELECTRONICS INDUSTRIES SA Bus

Transmission block specification: -41 (16 outputs), -42 (8 outputs)

#### LED indicator

Indicator	Description
Power	<ul> <li>Lights up when power is turned on</li> </ul>
Error	•Lights up during faulty transmission or other faults

#### Remarks

- $\%\,\mbox{For details}$  of the SA Bus system, see the KOYO ELECTRONICS INDUSTRIES catalog, user's manual. etc.
- Number of outputs per block
- 16 solenoids (transmission block specification: -41) 8 solenoids (transmission block specification: -42)
- Related materials: User's manual. document No. HV009

#### For OMRON SYSBUS Wire System

Transmission block specification: -21

Indicator	Description
RUN	<ul> <li>Lights up when transmission is normal, and the PC is in operations mode or monitor mode</li> </ul>
T/R ERR	•Flashes during normal transmission •Lights up during standby or faulty transmission •Shuts off during faults (during watchdog timer fault)

#### Remarks

- Master station unit: SYSMAC-C (CV) series C200H-RM201, C500-RM201
- % For details, see the OMRON's programmable controller SYSMAC C(CV) series catalog, user's manual, etc.
- Number of outputs per block Maximum of 16 solenoids
- Related materials: User's manual, document No. HV007

#### For SUNX S-LINK

Transmission block specification: -51 (16 outputs), -52 (8 outputs)

#### LED indicator

Indicator	Description
POWER	<ul> <li>Lights up when power is turned on</li> </ul>
SEND	•Flashes during normal transmission •Lights up or shuts off during faulty transmission

#### Remarks

- % For details of the S-LINK System, see the SUNX catalog, user's manual, etc.
- Number of outputs per block 16 solenoids (transmission block specification: -51) 8 solenoids (transmission block specification: -52)
- Related materials: User's manual, document No. HV010

FM-SOLID MANIFOLD X88M SERIES

#### ●For Mitsubishi Electric MELSEC I/O LINK

Transmission block specification: -61

#### LED indicator

Indicator	Description
PW	•Lights up when power is turned on
RUN	•Lights up when receiving data transmitted from master unit is normal
SD	•Lights up during sending data to master unit
RD	•Lights up during receiving data from master unit
ERR.	•Lights up when faulty data transmitted from master unit

#### Remarks

- 16 remote I/O unit connection stations, for a maximum of 128 inputs/outputs
- % For details, see Mitsubishi Electric's sequencer catalog, user's manual, etc.

Number of outputs per block

- Maximum of 16 solenoids
- Since the block is equivalent to 4 stations, if substations are entirely composed of the blocks, a maximum of 4 units can be connected to 1 master unit.
- Related materials: User's manual, document No.
   HV011

#### For OMRON CompoBus/D

Transmission block specification: -91

#### LED indicator

Indicator	State	Color	Description	
Indicator	State	Color Description		
	Lights up	Green	<ul> <li>Normal state</li> </ul>	
	Flashing	diccii	<ul> <li>No setting state</li> </ul>	
MS	Lights up	Red	<ul> <li>Serious breakdown</li> </ul>	
	Flashing	neu	Minor breakdown	
	Shuts off	_	<ul> <li>No power supply</li> </ul>	
NS	Lights up	Green	Communication connection completed	
	Flashing	arcen	No communication connection	
	Lights up	Pod	Serious communication fault	
	Flashing	neu	Minor communication fault	
	Shuts off	_	•No power supply	

#### Remarks

- \* For details of the CompoBus/D, see the OMRON catalog, user's manual, etc.
- The transmission block is OMRON's remote adaptor-type **DRT1-OD16X**. For details about handling, see OMRON's user's manual.
- Number of outputs per block Maximum of 16 solenoids
- Related materials: User's manual, document No. HV014

#### For Fuji Electric FA Components & Systems T Link Mini

Transmission block specification: -71

Station number setting switch

ON/OFF switch for terminating resistance

#### LED indicator

Indicator	Description
PWR	<ul> <li>Lights up when power is turned on</li> </ul>
ALM	•Lights up during faulty transmission

#### Remarks

- % For details of the T Link Mini, see the Fuji Electric FA Components & Systems catalog, user's manual, etc.
- Number of outputs per block Maximum of 16 solenoids
- Related materials: User's manual, document No. HV012

#### **•**For KEYENCE KZ-R

Transmission block specification: -81

#### Error holding swtich

#### LED indicator

Indicator	Description			
	•Green:	Lights up for normal communications state		
POWER/ ERROR	•Orange: Lights up when comm cations state is poor (can also light up whe address settings are incorrect)			
	•Red:	Lights up during faulty operation, or when transmission is cut off		

#### Remarks

- % For details of the KZ-R, see the KEYENCE catalog, user's manual, etc.
- Number of outputs per block Maximum of 16 solenoids
- Related materials: User's manual, document No. HV013

#### For OMRON CompoBus/S

Transmission block specification: -A1 (16 outputs), -A2 (8 outputs)

#### LED indicator

Indicator	State	Color	Description	
PWR	Lights up	Green	<ul> <li>During power supply</li> </ul>	
	Shuts off		<ul> <li>Power not supplied</li> </ul>	
COMM	Lights up	Yellow	•During normal communication	
	Shuts off		Communication fault, or standby	
ERR	Lights up	Red	<ul> <li>Communication fault occurred</li> </ul>	
	Shuts off		During normal communication, or standby	

#### Remarks

% For details of the CompoBus/S, see the OMRON catalog, user's manual, etc.

- Number of outputs per block
   16 solenoids (transmission block specification: -A1)
   8 solenoids (transmission block specification: -A2)
- Related materials: User's manual, document No. HV015

#### •For Mitsubishi Electric CC-Link

Transmission block specification: -B1

#### I FD indicator

Indicator	Description		
PW	<ul> <li>Lights up when power is turned on</li> </ul>		
L RUN	•Lights up when normal data is received from master station		
SD	•Lights up during sending data		
RD	•Lights up during receiving data		
L ERR.	Lights up during transmission errors, and shuts off when time is over Lights up during station number setting error or transmission speed setting error		

#### Remarks

- %For details of the CC-Link, see the Mitsubishi Electric catalog, user's manual, etc.
- Number of outputs per block
- 16 solenoids (transmission block specification: -B1) Since the block occupies 1 station, if remote I/O stations are entirely composed of the blocks, a maximum of 64 units can be connected to 1 master station.
- Related materials: User's manual, document No. HV016

For about specifications and handling details, see the above-listed user's manuals (document Nos. HV005~HV016).

# FM-SOLID MANIFOLD X88M series

# **Piping Modules**

#### Features

Selectable according to piping requirements, for reducing of piping work, and for easier maintenance.

#### Built-in quick fitting type

The 1(P) port offers 4 types of built-in quick fittings, straight and elbow types for both  $\phi$  8 and  $\phi$ 10 tubes. The 3, 5(R) port is equipped with a built-in muffler.

#### Port female thread type

The 1(P) port has an Rc1/8 or Rc1/4 female thread. The 3, 5(R) port has a built-in muffler.

#### All port female thread type

The 1(P) port and 3, 5(R) port have Rc1/4 female threads.

#### All port female thread type, side piping specification

Can select right side or left side piping, for increased flexibility of piping direction and greater space savings. The 1(P) port and 3, 5(R) port have Rc1/4 female threads.

#### **Piping Module Specifications**

Model	1(P) port specification	3, 5(R) port specification		
FMP-FJ8S	With straight quick fitting for $\phi$ 8 tube			
FMP-FJ8L	With elbow quick fitting for $\phi$ 8 tube	With built-in muffler (exhausts to atmosphere)

# **Air Preparation Modules**

#### Features

Achieves even greater space savings and integration, from air preparation to pressure control.

#### Filter module

Filtration is  $5 \mu$ m. Maximum flow rate of 800  $\ell$ /min [28.2 ft<sup>3</sup>/min.] (ANR). The P port has an Rc1/4 female thread.

#### **Regulator module**

The pressure regulating range is  $0.15\!\sim\!0.7 MPa$  [22 $\sim\!102 psi.].$ 

The P port has an Rc1/4 female thread.

The pressure gauge has 1MPa [145psi.] and 10kgf/cm<sup>2</sup> [142psi.] specifications for both the bottom and back piping, for 4 types of ranges.

#### **Air Preparation Module Specifications**

#### Electronic type pressure switch module

Mounts the digital pressure gauge GS520 equivalent to allow pressure setting while reading the display. The wiring type includes both a plug-in type and connector type.

#### Mechanical type pressure switch module

The pressure gauge connection port size for the mechanical type pressure switch is Rc1/8.

The wiring type includes both a plug-in type and connector type.

## Valve Modules

### Features

Reliable solenoid valves 110 and 180 series have been converted to valve type modules with their specifications unchanged. In addition, by using single-footprint mounting of combined 2-unit solenoids in one body, a tandem solenoid valve with a standard single station mounting area has been newly added to the product range. All are plug-in types with compact appearances, to achieve even greater space savings.

### Direct piping type (Single solenoid, twin solenoid)

The  $\phi$  4 and  $\phi$  6 quick fitting types can be selected for the valve 4(A) and 2(B) ports.

### Base piping type (Single solenoid, twin solenoid, tandem solenoid)

The 4(A), 2(B) ports on the module base offer a range of 4 types of quick fittings with straight and elbow types for both  $\phi$  4 and  $\phi$  6 tubes, and of an M8M female thread type.

### How to obtain cylinder speed

To obtain the time required for the cylinder to complete 1 stroke, add cylinder's delay time t1 (time between energizing of the solenoid valve and actual starting of the cylinder), to the cylinder's max. speed operating time t2. When a cushion is used, add the cushioning time

t3, to the above calculation. The standard cushioning time t<sub>3</sub> is approximately 0.2 seconds.

How to read the graph

When the supply pressure is 0.5MPa [73psi.] and flow rate is 210  $\ell$  /min [7.41ft3/min.] (ANR), the valve outlet pressure becomes 0.4MPa [58psi.].

 $1MPa = 145psi., 1\ell /min = 0.0353ft.^3/min.$ 

### Solenoid valves MPa 0.7 Supply pressure 7 (MPa) 180 series Λ 0.6 Valve outlet pressure 0.5 0.4 0.3 0.2 FMX180-4E1 FMX180-4KE2 FMX183-4KE2 0.1 0 200 400 600 800 1000 Flow rate ℓ /min (ANR)

### How to read the graph

When the supply pressure is 0.5MPa [73psi.] and flow rate is 460  $\ell$  /min [16.24ft<sup>3</sup>/min.] (ANR), the valve outlet pressure becomes 0.4MPa [58psi.].

1MPa = 145psi., 1 l /min = 0.0353ft.3/min.

## **Ejector Modules**

### Features

The micro ejector ME05 and ME07 series are integrated with modules to enable combination mounting with valves, collecting of wires and piping, and compact integration of vacuum generation and control functions.

All models are powerful, with built-in filters, nozzle diameters of 0.5mm [0.020in.] (ME05) and 0.7mm [0.028in.] (ME07), and a maximum vacuum rating of -650mmHg [-25.6in.Hg] (air pressure 86.7kPa [12.6psi.]).

### Ejector module with single solenoid valve

The 2(B) port can be used with 4 types of quick fittings, including a straight type and elbow type for each of the  $\phi$  4 and  $\phi$  6 tubes, and a M8 female thread.

### Ejector module with twin solenoid valves

Mounts a vacuum breaking air control solenoid valve for easier vacuum breaks and releasing vacuum picked up workpieces.

The 2(B) port can be used with 4 types of quick fittings, including a straight type and elbow type for each of the  $\phi$  4 and  $\phi$  6 tubes, and a M8 female thread.

### With vacuum switch

The pressure adjusting range is  $-101.3 \sim 10.1$  kPa { $-760.0 \sim 75.8$ mmHg} [ $-29.921 \sim 2.984$ in.Hg].

Offers easy control of vacuum levels, confirmation of the presence or absence of workpieces, and picking up or releasing of them.

# FM-SOLID MANIFOLD X88M series

## **End Blocks**

### Features

- End block piping types are also in the product range.
- Three types offer minimum installation space.
- End blocks with DIN rail mounting brackets are also available as an option.

![](_page_61_Picture_6.jpeg)

![](_page_61_Picture_7.jpeg)

X88M-ED

![](_page_61_Picture_9.jpeg)

X88M-DN

### **End Block Mass**

Module Mass			
Model	Mass		
X88M	140 [4.94]		
X88M-ED	145 [5.11]		
X88M-DN	280 [9.88]		

![](_page_62_Picture_1.jpeg)

### End block module type X88M (right and left) 1 set

- The drawing shows a left-side end block with the solenoid on the upper side of the case.
- •The right-side end block with the solenoid on the upper side of the case is right-left symmetrical to the left-side end block in dimensions, location of mounting holes, locations of piping ports, etc.

![](_page_62_Figure_5.jpeg)

### End block piping type

## X88M-ED (right and left) 1 set

- The drawing shows a left-side end block with the solenoid on the upper side of the case.
- •The right-side end block with the solenoid on the upper side of the case is right-left symmetrical to the left-side end block in dimensions, location of mounting holes, locations of piping ports, etc.

![](_page_62_Figure_10.jpeg)

## With DIN rail mounting bracket type **X88M-DN** (right and left) 1 set

- The drawing shows a left-side end block with the solenoid on the upper side of the case.
- The right-side end block with the solenoid on the upper side of the case is right-left symmetrical to the left-side end block in dimensions, location of mounting holes, locations of piping ports, etc.

![](_page_62_Figure_14.jpeg)

![](_page_63_Figure_1.jpeg)

Internal circuit

Standard solenoid

### DC12V, DC24V

![](_page_63_Figure_5.jpeg)

### AC100V, AC200V

![](_page_63_Figure_7.jpeg)

### Tandem solenoid

### OC24V

![](_page_63_Figure_10.jpeg)

- Cautions: 1. Do not apply megger between the pins. 2. The DC12V and DC24V solenoids will not
  - 2. The DC12V and DC24V soleholds will hot short circuit even if the wrong polarity is applied, but the valve will not operate.
  - For a twin solenoid, avoid energizing both solenoids simultaneously. The valve could enter the neutral position.
  - 4. Leakage current inside the circuit could result in failure of the solenoid valve to return, or in other erratic operation. Always use it within the range of the allowable leakage current. If circuit conditions, etc. cause the leakage current to exceed the allowable leakage current, consult us.
  - Since the tandem solenoid valve (DC24V specifications) does not have any polarity, it can be used with either positive or negative common.

![](_page_63_Picture_16.jpeg)

### Non-locking type

To operate the manual override, use an object with a fine tip to press it all the way down. For single solenoid, the valve works the same as when in the energized state as long as the manual override is pushed down, and returns to the normal position upon release. For the twin solenoid, pressing the manual override on the 12 (S1) side switches the 12 (S1) to enter the energized position, and the unit remains in that position even after the manual override is released. To return it to the normal position, operate the manual override on the 14 (S2) side. This is the same for the solenoid 14 (S2).

![](_page_63_Picture_19.jpeg)

### Locking protruding type

To lock the manual override, use a small screwdriver to turn the adjusting knob several times in the clockwise direction to push the manual override all the way down. When locked, turning the adjusting knob several times in the counterclockwise direction releases a spring on the manual override, returns it to the normal position, and releases the lock. For the locking protruding type, when the adjusting knob is not turned, this type acts just like the non-locking type when in the energized position as long as the manual override is pushed down, and returns to the normal position upon release.

![](_page_63_Picture_22.jpeg)

- Cautions: 1. The 110, 180 series valves are internal pilot type solenoid valves; the manual override cannot switch the main valve without air supplied from the 1(P) port.
  - Always release the lock on the locking protruding type manual override before commencing normal operation.
  - Do not attempt to operate the manual override with a pin or other object having an extremely fine tip. It could damage the manual override button.

### Locking type (Tandem solenoid)

To lock the locking-type manual override, use a small screwdriver to push the manual override in all the way down, then set the 0 position as the reference point and turn it in the clockwise direction as far as position A. This achieves the same conditions as when the 14(SA) side is energized, and the manual override is locked in place. For the 12(SB) side, turn it in the counterclockwise direction as far as position B. To release the lock, return the manual override to the 0 position. A spring mechanism returns the manual override to its normal position, and the lock is released. Care must be exercised to avoid excessive turning of the manual override, which could damage it.

![](_page_63_Picture_28.jpeg)

### Locking protruding type, locking type manual lever

To lock the locking protruding type manual override or locking type manual lever, use either a small screwdriver or your fingertips to push the manual override (manual lever) in all the way down, then set the 0 position as the reference point and turn it in the clockwise direction as far as position A. This achieves the same conditions as when the 14(SA) side is energized, and the manual override (manual lever) is locked in place. For the 12(SB) side, turn it in the counterclockwise direction as far as position B. To release the lock, return the manual override (manual lever) to the 0 position. A spring mechanism returns the manual override (manual lever) to its normal position, and the lock is released. Care must be exercised to avoid excessive turning of the manual override (manual lever), which could damage it.

![](_page_63_Figure_31.jpeg)

- Cautions: 1. The110, 180 series valves are pilot type solenoid valves; the manual override cannot switch the main valve without air supplied from the 1(P) port.
  - Always release the lock on the locking type and locking protruding type manual override, and locking type manual lever before commencing normal operation.

![](_page_64_Picture_0.jpeg)

Filter module

### Inner construction

![](_page_64_Figure_3.jpeg)

![](_page_64_Figure_4.jpeg)

### Major parts and materials

No.	Parts	Materials	
1	Body	ADC	
2	O-ring	Synthetic rubber (NBR)	
3	Element holder	Plastic	
(4)	Filter element	Plastic	
5	Baffle	Plastic	
6	Bowl	Plastic	
7	Connecting rod		
8	Pressure plate	—	
9	Filter base (L)		
10	Filter base (R)	Aluminum alloy	

### Mounting and piping

- 1. As with the FM-SOLID MANIFOLD, any mounting direction is acceptable.
- Air supply piping ports (Rc1/4) are provided in two places, the filter body and the manifold base, for versatile application in accordance with supplying flow rate and piping direction requirements.
- Always flush out the piping interior before commencing piping work.
- 4. The air supply connection ports are temporarily closed with plugs. Remove the plug once from the port that is not used in piping, and attach it again after applying a sealing agent.

### Media

The filter module is an in-line filter developed especially for the FM-SOLID MANIFOLD. Unlike a conventional filter, it has no drain function. Use clean air containing no deteriorated compressor oil, collected liquid, and dust, etc.

### Bowl and bowl guard

- Do not apply excessive force or shocks to the bowl, which is made of polycarbonate. Also, avoid using the bowl in an atmosphere containing organic solvents, etc.
- 2. When installing or removing the bowl and bowl guard, always exhaust the air first.
- **3.** The bowl and bowl guard are connected by a thread. Rotate the bowl guard for installation and removal.
- 4. To assemble the bowl and bowl guard, set an O-ring on the filter body.
- 5. Use a neutral detergent to clean the bowl.

### Filter element Order code: (F3F-01)

- 1. Clean the filter element periodically (every 3~6 months).
- 2. Blow the filter element with compressed air to clean it.
- **3.** To remove the filter element, first remove the baffle (threaded type) and both will come off.
- **4.** To mount the filter element, assemble in the following order: ① element holder, ② element, and ③ baffle, and tighten until the element is secured in place. Tighten by hand until it is firmly secured. Any further tightening torque could damage the filter.
- Note: Make sure to remove any dust found in the interior of the element. If not, the dust might be flushed out to the secondary side of the filter.

### Others

If using a piping module for air supply, the piping module is required to be installed on the primary side of the filter module.

![](_page_65_Picture_1.jpeg)

Regulator module

![](_page_65_Figure_3.jpeg)

![](_page_65_Figure_4.jpeg)

### Major parts and materials

No.	Parts	Materials
1	Body	ADC
2	Diaphragm	Synthetic rubber (NBR)
3	Bonnet	Plastic
(4)	Pressure regulating spring	SWPB
5	Knob	Plastic
6	O-ring	Synthetic rubber (NBR)
7	Connecting rod	_
8	Pressure plate	
9	Regulator base (L)	
10	Regulator base (R)	Aluminum alloy

### Mounting and piping

- 1. As with the FM-SOLID MANIFOLD, any mounting direction is acceptable.
- 2. Air supply piping ports (Rc1/4) are provided in two places, the regulator body and the manifold base, for versatile application in accordance with supplying flow rate and piping direction requirements.
- **3.** Always flush out the piping interior before commencing piping work.
- **4.** The air supply connection ports are temporarily closed with plugs. Remove the plug once from the port that is not used in piping, and attach it again after applying sealing agent.

### Media

Use clean air containing no deteriorated compressor oil, collected liquid, and dust, etc.

### Lubrication

The product can be used without lubrication, however, when the actuator requires lubrication, use Turbine Oil Class 1 (**ISO VG32**) or the equivalent. Avoid using spindle oil or machine oil.

### Pressure regulation

- 1. To regulate the pressure, pull the knob out firmly, and turn it to the right (clockwise) to increase the pressure, and to the left (counterclockwise) to reduce the pressure. After pressure regulation, push the knob down into the body and lock it in place.
- To stabilize pressure on the secondary side, set the pressure difference between the supply side and regulating side at 0.2 MPa {2kgf/cm<sup>2</sup>} [29psi.] or more.
- Note: The regulator module is an internal pilot type regulator specially made for the FM-SOLID MANIFOLD. The regulator in the pilot portion uses a metal seat that bleeds slightly during pressure regulation. This is normal and not a problem for operations.

### Mounting pressure gauges

- **1.** Two types of pressure gauges are available as options for the regulator module. Use them as applications require.
- 2. For mounting, screw in the pressure gauge connector (R1/8) to the gauge port (Rc1/8) on the regulator body. Always use a wrench on the hexagonal part of the pressure gauge connector to tighten. Tightening torque
  - ●-GA20, -GD20 (*ϕ*20 pressure gauge) Max. –294.2N cm {30kgf cm} [26.0in·lbf]
- 3. When not using a pressure gauge, screw in the provided plug after applying sealing agent to the port.

### Others

- **1.** When using a piping module for air supply, install the piping module on the primary side of the regulator module.
- Avoid operation of the pressure switch (ON, OFF) on the primary side of the regulator module, as it shortens the life of the regulator.
- **3.** Since the regulator module uses a normally bleeding type of pilot regulator, a cut-off of air supply from the primary side automatically causes a loss of balance with the secondary side, and residual pressure is exhausted.

![](_page_66_Picture_0.jpeg)

Electronic type pressure switch module (for individual wiring type)

### Input/output circuit (for individual wiring connector type)

\* For plug-in type, see p.492.

### Circuit diagrams

![](_page_66_Figure_5.jpeg)

### Wiring

Perform wiring work with attention to the power supply polarity and connector terminal numbers. The numbers in parentheses ( ) in the above circuit diagram show the terminal numbers. For connector handling precautions, follow the procedure below:

\* Connector: OMRON XS2 sensor I/O connector

- Assembling procedure
- (1) Inserting parts and wiring

![](_page_66_Figure_11.jpeg)

- Pre-solder the lead wires and terminals, and then firmly solder them in place.
- •When the cable dimension after soldering exceeds 6.5mm [0.256in.], the protective structure cannot perform properly.

### (3) Assembly

Align the triangle mark on the contact block position key with the triangle mark on the cover, and insert the cover into the contact block. When using an L type cover, the relationship between the insert surface side polarity key position and the cable out direction is determined by the position where the position key is inserted into the cover (settings in  $90^{\circ}$  intervals are possible). To insert it, push in strongly until the position key cannot be seen from the case side surface.

![](_page_66_Figure_16.jpeg)

### Precautions

- Tighten the cap by hand (tightening torque: 39.2~49.0 N·cm {4~ 5kgf·cm} [3.5~4.3in·lbf]. Use of pliers, etc., could cause damage. Insufficient tightening could lead to failure to maintain the protective structure, and to gradual loosening from vibration.
- 2. Always cut the power before inserting or pulling out the connector.

### Others

- Notes: 1. Check the power supply fluctuations to ensure that the power, voltage, and inputs do not exceed rated levels.
  - When using a switching regulator for the power supply, always provide a Frame Ground (FG) terminal.
  - 3. Avoid transient states (about 50ms) when turning on the power supply.
  - 4. Use clean air containing no deteriorated compressor oil, collected liquid, and dust, etc.
  - 5. Use within the rated pressure range (MAX. 0.7MPa [102psi.]).
  - 6. Care must be exercised to avoid incorrect wiring.
  - 7. Do not apply excessive force to the power supply cable and connector.
  - 8. Since the outer diameter of the applicable cable for the connector is  $\phi$  4 [0.16in.], use a cable outer diameter range of  $\phi$  3 [0.12in.] $\sim \phi$  5 [0.20in.].

### Handling instructions and precautions

Four output modes offer flexible control.

### 1 Hysteresis mode

Enables freely setting the switch output response differential by setting

![](_page_67_Figure_5.jpeg)

### Window comparator mode

Enables switching of output ON and OFF within the setting pressure range .

![](_page_67_Figure_8.jpeg)

### 2-output mode

Versatile applications such as detection of different types of work, control and warning.

![](_page_67_Figure_11.jpeg)

### 4 Automatic sensitivity setting mode

All you need to do is to store the pressure values of Good items and NG items at the site, then the switch sets the value automatically.

![](_page_67_Figure_14.jpeg)

Enables peak hold and bottom hold displays.

Displays both the peak value (maximum value) and bottom value (minimum value) of the pressure fluctuation. Convenient when necessary to examine pressure variations or required to know pressure setting values as a guide.

![](_page_67_Figure_17.jpeg)

### Major parts and materials

![](_page_67_Figure_19.jpeg)

$\overline{\ }$	Parts	Function		
1	3 1/2 digits LED display (Red)	Displays the detected pressure value, as well as the setting contents, errors and key protect contents.

5	Setting value DOWN key (())	<ul> <li>In the initial setting mode, each pressing of the key successively displays the possible setting conditions.</li> <li>Regarding setting values 1 and 2 in the setting mode, pressing the key changes the setting value to the low pressure side.</li> <li>In the detection mode, continuously pressing the key for 4 or more seconds gives the bottom hold display.</li> </ul>	same time performs zero- point adjustment.	
6	Mode change key ())	<ul> <li>Each pressing of the key switches among the detection mode, set value 1 (P1) setting mode, and set value 2 (P2) setting mode.</li> <li>In the detection mode, continuously pressing the key for about 3 seconds sets or cancel the key protect function.</li> <li>In the detection mode, pressing the mode switch key while pressing the setting value UP key ( ) switches to the Initial setting mode.</li> </ul>		

### Error indication

When an error occurs, take the following measures.

![](_page_67_Figure_23.jpeg)

### Setting

- •When key protect has been set, always cancel key protect before operating the keys. (For the operating procedure, see the "About the key protect function.")
- Setting value 1 (P1) and setting value 2 (P2) can be used in all output modes.
- Setting value 2 (P2) is designed to be set only at a higher pressure than setting value 1 (P1).
- Setting value 3 (P3) is automatically set at an intermediate value between setting value 1 (P1) and setting value 2 (P2) (when using the automatic sensitivity setting mode to set the pressure).
- Although the setting conditions are filed and saved in EEPROM, caution should be exercised as EEPROM has a limited life, and writing to files is guaranteed only up to 100,000 times.

![](_page_68_Figure_7.jpeg)

### About the key protect function

Пл

• The key protect function disables key operation to ensure that conditions in each of the setting modes cannot be changed by mistake.

### Setting key protect

• In detection mode, keep pressing the insection when about 3 seconds, and then quickly release the key when is displayed.

 $(\boldsymbol{\cdot} \mathsf{Key} \text{ protect is set, and the system returns to the detection mode.})$ 

![](_page_68_Figure_13.jpeg)

Canceling key protect

• In detection mode, keep pressing the end key for about 3 seconds, and then quickly release the key when *IFF* is displayed.

 $(\cdot {\rm Key} \ {\rm protect} \ {\rm is canceled}, \ {\rm and} \ {\rm the system} \ {\rm returns} \ {\rm to} \ {\rm the detection} \ {\rm mode.})$ 

![](_page_69_Picture_1.jpeg)

Mechanical type pressure switch module (for individual wiring type)

### Mounting

- 1. As with the FM-SOLID MANIFOLD, any mounting direction is acceptable.
- 2. Avoid mounting in locations subject to strong vibrations.
- 3. Avoid mounting in locations subject to strong external magnetic fields.

### Media

Use clean air containing no deteriorated compressor oil, collected liquid, and dust, etc.

### Atmosphere

Do not use media or an environment containing any of the following substances: Organic solvents, phosphate ester type hydraulic oil, sulphur dioxide, chlorine gas, acids, etc.

### Wiring

1. For FMS110 (Reed switch type)

![](_page_69_Figure_13.jpeg)

•The system has no built-in contact protection circuit. Therefore, always take contact protection countermeasures when inductive loads or capacitative surges occur.

\*For the electrical specifications and contact protection circuits, etc., see the sensor switch items in the Actuators General Catalog.

![](_page_69_Figure_16.jpeg)

Electric noise causing erratic operation could be a problem for contacts with TTL, C-MOS, etc. In this case, connect a CR filter circuit to the black lead wire.

 For inductive loads, we recommend the use of a protective diode for surge suppression.

\*For the electrical specifications and contact protection circuits, etc., see the sensor switch items in the Actuators General Catalog.

- 3. Common for both types
- Pay attention to the lead wire color (polarity) when connecting wires. Incorrect connections can result in erroneous operation or damage.
- •Do not apply strong force or excessive bending moment to the lead wires.
- When the LED is ON, a red indicator lamp lights up.

### Pressure regulation

1. Turning the pressure regulation screw to the right changes the pressure setting to higher pressure, and turning to the left to lower pressure.

![](_page_69_Picture_26.jpeg)

Pressure regulation screw

- 2. The indicator shows the OFF pressure setting point. When changing from a higher to a lower pressure setting, the OFF signal appears at the setting pressure (the red LED shuts off).
  - The ON point is where pressure is shifted to the low pressure side by the response differential.
- **3.** Remember that the indicator can be used as a guide. For precise pressure settings, always use a pressure gauge, and check the switch settings by switching back and forth when setting.
- **4.** Switching the pressure settings back and forth  $2 \sim 3$  times will improve the setting accuracy.

### Others

- Because the module uses a magnetically sensitive sensor switch, avoid using it in locations subject to strong external magnetic fields, or near power lines and other large electrical current flows.
- 2. When connecting a pressure gauge to the gauge port (Rc1/8), the G1-20DPL\* type can be used (requires the quick fitting TS6-01.). Note, however, that it cannot be used in modules in which the height from the adjoining module base exceeds 50mm [1.97in.].
- 3. Additions or deletions cannot be made while the shield plate is in use.
- **4.** When using it with a shield plate, the pressure switch can be adjacently mounted.
- \*\*For details of G1-20DPL, see the General Catalog of Air Treatment, Auxiliary, Vacuum.

![](_page_70_Picture_0.jpeg)

## Electronic and mechanical type pressure switch module (for collective wiring type)

The wiring from the pressure switches is all connected to a supplied terminal block module.

### Major functions and part names of the terminal block

![](_page_70_Figure_4.jpeg)

### 1. 10-pin terminal block with M3 thread

Note: The terminals should be 6mm [0.24in.] or less for both the round-type terminals and Y-type terminals.

![](_page_70_Figure_7.jpeg)

### 2. Terminal location (Terminal block label)

Terminal location of pressure switch module up to 3 units.

![](_page_70_Figure_10.jpeg)

First terminal location Second terminal location Third terminal location

Note: Combination mounting of up to 3 plug-in type pressure switch modules can be wired to a single terminal block module.

### Circuit diagrams

![](_page_70_Figure_14.jpeg)

1. Electronic type pressure switch (for collective wiring type)

Pay attention to the power supply polarity and the terminal block's terminal numbers for wiring connections.

Only output 1 is available for FMS220 (collective wiring type  $\langle$  plug-in type  $\rangle$ ).

### 2. Mechanical type pressure switch

Reed switch type (2-lead wires)

![](_page_70_Figure_19.jpeg)

Pay attention to the power supply polarity and the terminal block's terminal numbers for wiring connections.

### Solid state type (3-lead wires)

![](_page_70_Figure_22.jpeg)

 $\ensuremath{\mathsf{Pay}}$  attention to the power supply polarity and terminal block sequence for wiring connections.

![](_page_71_Picture_1.jpeg)

Air preparation module Other information and data

### Maximum flow rate of FMR200 regulator module

When using a regulator module to supply air to valve modules, the number of valves used could lead to insufficient air supply pressure and flow rates, resulting in erratic valve operation or insufficient actuator output. See the table below when determining the number of regulator modules:

Solenoid valve model	Number of valves <sup>Note</sup>
110 series	10
180 series	4

Note: The valve number means the number of valves that can simultaneously supply air to the secondary side with a single regulator module.

Since the number of valves shown above is equivalent to the number of piping modules used, the number of piping modules also equals the number of regulator modules.

### Cylinder size and speed at the maximum flow rate (reference data) Conditions

- Primary pressure : 0.7MPa [102psi.] (constant)
- Secondary pressure : 0.5MPa [73psi.] (regulated at regulator module)
- Valve used : 180 series (direct piping type)
- Filter used : FMF200 filter module
- Piping module used : FMP-FJ10S
- Tube used between a valve and cylinder : N8-B-1000mm [39in.]

Bore size mm [in.]	φ 25 [0.984]	φ 32 [1.260]	φ 40 [1.575]	φ 50 [1.969]	φ 63 [2.480]
Usable numberNote 1	(10)	(6)	4	2	1
Cylinder speed <sup>Note 2</sup> mm/s [in./sec.]	500 [19.7]	500 [19.7]	500 [19.7]	500 [19.7]	500 [19.7]

Notes: 1. The usable number refers to the number of cylinders that can be simultaneously operated by a single regulator module.

2. Cylinder speed is the actual value measured in the above conditions.

![](_page_71_Picture_19.jpeg)

### **General precautions**

The FMJ05/07E2 ejector module differs from the conventional type of ME05/07-E2 series ejector, in that it does not have a built-in check valve. As a result, switching off the air supply solenoid valve sets the V port side to the atmospheric pressure level, as in the E1 type.

When countermeasures must be taken to keep vacuum within a volume chamber, or to prevent workpieces from falling during power failure, etc., always take sufficient precautions before use.

The vacuum breaking valves (with twin valves) are particularly effective for workpieces that need to be picked off more positively and quickly.

Replacement filters are also available (order code: ME05MA-F, ME07MA-F). Replace the filter on a periodic basis.

For specifications with a built-in check valve, consult us.

### FMJ E2 Symbol

![](_page_71_Figure_27.jpeg)
# Mounting

- While any mounting direction is allowed, avoid mountings that twist the manifold.
- When connecting piping to manifolds or other devices, flush the tubes completely by blowing compressed air before piping. If metal chips, sealing tape, or rust generated during piping work enters, it may cause a malfunction such as an air leakage.
- **3.** When mounting a valve unit inside the control panels, or when the operation requires long energizing periods, consider providing heat radiation.
- The valve module cannot be operated with the 4(A), 2(B) ports open to the atmosphere.

## Atmosphere

Avoid using it in the locations and environment listed below, as it could result in malfunction of the valve.

If use in such conditions is unavoidable, always provide a cover or other adequate protective measures.

- ①Location affected by strong vibration or impact
- ②Location with temperature exceeding the 5~50°C [41~122°F] range
- ③Location with large change in temperature and dew condensation

4 Location exposed to direct sunlight

- ⑤Location with atmosphere containing organic solvents, phosphate acid ester type hydraulic oil, sulphur dioxide, chlorine gas, or other acids
- ⑥Location directly exposed to water drops and oil drops.
- ⑦Environment where the valve body is subject to dew condensation
- (B)Location where the valve body is directly exposed to metal chips, dust particulate, etc.

#### Media

- 1. Use air for the media. For the use of any other media, consult us.
- 2. Air used for the cylinder should be clean air that contains no deteriorated compressor oil, etc. Install an air filter (filtration of 40 µm or less) near the valve to remove collected liquid or dust. In addition, drain the air filter periodically.
- Use the manifold without lubrication as much as possible. When the actuator requires lubrication, use Turbine Oil Class 1 (ISO VG32) or the equivalent. Avoid using spindle oil or machine oil.

# Piping

- For the 1(P) port piping, use a size that matches the manifold's piping connection port. Insufficient flow rate or pressure could result in defective valve operation or in insufficient actuator output.
- When installing piping or mufflers to the 3, 5(R) port, ensure minimum exhaust resistance.
- 3. On rare occasions, exhaust gas can interfere with other valves and actuators. In this situation, either install piping modules at both ends for exhaust, or install port islators at an intermediate location to isolate the exhaust air, and separate the exhaust in combination with a piping module.
- 4. When a multiple number of valves are operated simultaneously on a multistation manifold, or in high-frequency application, install piping modules on both ends, and supply air from the 1(P) port and exhaust it from the 3, 5(R) port.

# Wiring

- 1. Confirm positive common or negative common.
- **2.** Firmly insert connectors and tighten screws.
- Confirm the polarity of the power supply and pin locations, and connect correctly. (For details, see the wiring module page.)

# Valve module

When mounting solenoid valves 110, 180 series, the solenoid is a plug-in type and valve modules are already connected to the wiring modules by wiring, so that there is no need for wiring at each station.

◆Precautions for use of the twin solenoid valve When using the base piping type twin solenoid valve (FMW110-4KE2, FMW113-4KE2, FMW180-4KE2, FMW183-4KE2), use with plugs inserted in the 4(A) and 2(B) ports (quick fitting) on the right side ports (see the illustration below).

Note that the twin solenoid valve occupies 2 stations of the single solenoid valve base, which means that valve replacement on the base is possible.

# Piping module

Piping modules are divided into 2 types, a port type and a built-in muffler type.

In addition, the use of air supply and exhaust, and using multiple units, makes the module also be used as a piping branch.

#### Piping in an embedded port

When the air supply port in the built-in muffler type has a female thread specification (FMP-FR01, -FR02), use a wrench on the port's hexagonal portion to secure it in place while piping.

#### Precautions

While air supply and exhaust for the valve module are performed by using this piping module, the number of valves in use could lead to air supply pressure and flow rate shortages, resulting in defective valve operation or in insufficient actuator output. See the table below when determining the required number of piping modules.

#### Number of valves that can operate with a single piping module

Solenoid valve model	Number of valves*	
110 series	Max.10	
180 series	Max.4	

\*\*Number of valves does not refer to the valves that could be mounted on a single manifold. It is the number of valves that enables to supply of air simultaneously to a secondary side by using a single piping module.

- (Example) When ten 180 series solenoid valves are mounted on a single manifold, and 6 of those valves are in simultaneous operation, use 2 piping modules.
- (Example) When ten 180 series solenoid valves are mounted on a single manifold, and 3 of those valves are in simultaneous operation, use 1 piping module.

# Port isolator

The following 3 types of port isolators are available:

Purposes	Model
Block supply air	FMB-P
Block exhaust air	FMB-R
Block supply and exhaust air	FMB-A

#### Precautions

- Confirm a marking label on the bottom of the manifold for port isolator locations. (Because the port isolators are assembled inside the manifold base, the outward appearance and dimensions do not change.)
- (2) While a port isolator can be installed in any location required on each module, its position cannot be changed after shipping.
- (3) The port isolator is located on the left side of the designated module (solenoid on top). Therefore, it blocks the air for that portion (see the diagram).

# Example of system configuration

When the controller is negative common, the manifold side should be positive common. And when the controller is positive common, the manifold side should be negative common.

In this system configuration example, the controller side is always negative common type (and the manifold side is positive common type).

# When the output unit requires no power supply.

- <A system that uses a cable to transmit control voltage only>
- The power supply connection terminal (Fcc, D-sub connector type) uses positive polarity wiring only, with the negative polarity left open as a dead terminal.
- Since the terminal block type's common is a positive polarity, use it as shown for wiring:

#### When the output unit requires a power supply

#### $\operatorname{Method} (1)$

- •Connect positive and negative power supply to the power supply connection terminal, and supply power to the output unit through the connection cable's positive and negative lines.
- Can be shared with the same cable as the control voltage.

Note: The terminal block type uses the procedure shown below.

#### Method 2

- •Supply power to the output unit, and connect a positive line to the manifold side.
- Leave the negative polarity as a dead terminal.
- •For the terminal block type, connect the positive line to the common.

#### How to use the power supply connection terminal

Power supply terminal blocks (power supply connection terminals) are provided for the FMC-F200, -D250, -E250 units. In output units where power supply from the output is required for the internal circuits (see the diagram), power lines can be connected to the same cable, in the same way as load (solenoid) lines.

#### Connection diagram between PC and manifold (connector)

#### Line A : COM (0V or negative) line Line B : +V line

	FMC-F200	FMC-F201	FMC-D250	FMC-E250
(-)	17, 18	9, 19	20,21,22	20,21,22
(+)	19, 20	10, 20	23,24,25	23,24,25

## Mounting onto a DIN rail

When mounting the manifold onto a DIN rail, follow the procedure shown below. Applicable DIN rail : Equivalent to DIN standard (EN50022)

#### Mounting procedure

The DIN rail mounting bracket is composed of an upper and lower two-part construction.

- ① Loosen the end block mounting bolts beforehand (2 pcs. for each block).
- \*Loosen the nut until just before it separates from the bolt.

(2) Tilt the manifold and latch one side of the lower hook (area A) onto the DIN rail edge.

③ Set the manifold parallel to the DIN rail, and slide the lower bracket so that the other hook (area B) also latches onto the DIN rail. Leave it loose as it slides, and then alternately tighten the mounting bolts.

④ Completion
■ Removing procedure
When removing, follow the reverse mounting procedure for easy removal.

# Replacement of muffler

For replacement of the muffler when using the built-in muffler type piping module (FMP- $F\Box$ ), follow the procedure shown below.

Order code for muffler only: F3P-01

# Replacing procedure

- Remove the mounting screws (4 pcs.) securing the air supply/exhaust block.
- ② Remove the muffler to be replaced. (At this time, take caution to avoid losing the gasket.)
- ③ Attach the gasket to the seat of the base, and insert the new muffler until it reaches the bottom of the groove.
- ④ Set the air supply/exhaust block in the normal position ①, and tighten the mounting screws. (Tightening torque: 58.8N.cm {6kgf.cm} [5.2in.lbf])

#### Replacement of valves

#### Removing procedure

Remove the 2 mounting screws (4 pcs. for the twin solenoid), and lift in the direction shown by the arrow (see the illustration). Because the solenoid is a plug-in type, moving it in any other direction than that indicated by the arrow could damage the terminals.

#### Mounting procedure

Mount new gaskets on the valve. Then, set the solenoid terminal into the insert opening, and tighten the mounting screws.

(Tightening torque:110 series:44.1N·cm {4.5kgf·cm} [3.9in·lbf], 180 series: 68.6N·cm {7kgf·cm} [6.4in·lbf]

# Adding on modules

If disassembling this manifold for the purpose of adding units, etc., the gaskets and internal wiring could be damaged, or during reassembly the gasket could be caught in the gap, or the wiring could become defective, etc. For this reason, avoid disassembly or reassembly after delivery. (The manifold is checked before shipping for energizing, air leaks, etc.)

However, if you must add units to the manifold for some reason, consult us.
