● Conductive vacuum pad (NBR, silicone)

The vacuum pad rubber material is conductive rubber, for passing static electricity and preventing electrification.

● Halogen processed vacuum pad (NBR)

Halogen processed rubber in the vacuum pad reduces the rubber's friction resistance by 88%^{Note} reducing the occurrence of rubber pad's picking marks.

Note: Koganei comparisons. Rubber material is NBR.

Volume resistivity, and identification mark

Rubber pad material	Volume resistivity ^{Note}	ID mark

Conductive silicone	$1 \sim 10^2 \Omega\text{cm}$	Yellow point mark
Halogen processed NBR	—	Brown point mark

Handling Instructions and Precautions

Vacuum pad

Piping

To reduce piping resistance, keep the piping length as short and straight as possible, and avoid use of spiral piping.

Mounting position

In principle, use perpendicular lifting, and avoid slanted or parallel lifting if at all possible. If such an application cannot be avoided, ensure adequate safety margins. (For details, see p.615)

Storage

1. The vacuum pad (including rubber pad) uses various kinds of rubber. The rubber can deteriorate due to direct sunlight, oil, water, and ozone, etc. Before use, always store it indoors, sealed in a polyethylene bag.
2. Maintain the storage temperature at room temperature.
3. Limit storage to two years from the date of manufacture.

Replacement of rubber pad

When replacing the rubber pad, refer to the dimensions of rubber pad mounting portion to remove the rubber pad, screw, and mounting body, etc., and then replace the rubber pad. When assembling the mounting body to rubber pad KP-15 to KP-40, slowly screw the mounting screw to assemble the mounting body and rubber pad. To securely tighten, rotate the mounting screw by one-half turn (180°) further after they are closely contacted. Note that the rubber pad mounting screw differs for each rubber pad size, from KP-10 to KP-50. For details, see "Dimensions of Rubber Pad Mounting Portion." (For details, consult us.)

General precautions

1. Use one vacuum pad for one micro ejector unit. Use of two or more vacuum pads could result in picking errors, and extend the amount of time required to reach the set vacuum level.

2. When connecting piping to the spring type vacuum pad with mounting body, be careful to avoid applying excessive force to the body, as it could result in defective spring operation or in wear on moving parts.

Tightening torque

When mounting a vacuum pad, use the values in the table to the right for the nut tightening torque.
